HCC Jenkins Migration								
Description	Successfully complete the migration of all necessary repositories to a new instance of Jenkins for the HCC team.							
Comments	The old instance of Jenkins was moving into a stale "read only" state. This meant that a new instance needed to be stood up and all necessary work needed to be migrated before the deadline. In order to accomplish this, the Data Externalization organization needed to be sifted through for current and necessary repositories which needed to continue using Jenkins for CI/CD. There are more than 600 repositories in the organization. I wrote a script that sorted the repositories into multiple categories (HCC, HCP, repos that use Jenkins, etc.). After collaborating with members outside of our direct team, It was determined that upwards of 70 repositories needed to be moved to our new Jenkins instance. Collaboration and communication with others, both internal to our team and outside allowed me to make the decisions on what needed to be done with each of the 600 repositories. Being a very new member on the team and to the company at the time, taking initiative and risks was crucial in being able to complete this task. Finally, self management played a very important role in this process as we were facing a hard deadline. I decided how much time I should dedicate to automating the process and how much I needed to do manually. I also tracked the progress of the migration very carefully in order to make sure the task was done to completion and the team would not be losing any critical work. Tracking the process included individually recording each repository at every step in the migration, i.e "need to migrate", "in progress", "blocked/error", "completed". The goal was achieved and the migration was completed on time.

Business Goals				

Description

Gain familiarity with all the different sections of the HCC Data Platforms team.

Comments

As a first rotation TDP on the HCC Data Platforms team, one of my biggest goals has been to learn an abundance of skills and be exposed to as many different things as possible. I started off working closely with our observability team where I was exposed to Jenkins and Grafana. After finishing the Jenkins migration and helping improve our Grafana backup and restore procedures, I was able to move over to the Kafka team. I was first exposed to Site Reliability Engineering and worked to define SLIs and SLOs for Kafka. This experience helped me understand the standards that we have for our product and how we can provide the best solutions to our customers. Other experiences I have had working with the Kafka team include basic Kafka operations, error handling and an overall strong understanding of the product.

Gaining familiarity with different aspects of our team has helped me to understand our overall goals, priorities and plans. In order to do effective work, it is important for me to know those three things about the team I am working on. Through all of the tasks I have worked on across a couple of internal groups within our team, I believe I improved my ability to build and apply technical and functional skills.

I have gained an abundance of knowledge on this team and have become familiar with most of our operations, leading me to believe I have successfully accomplished this goal.

Kafka @ Azure

Description

Contribute to the teams effort of getting Kafka running at Azure. Whether it be directly working on that effort, or taking some work off of others plate, provide support in order to get the task completed in a timely manner.

Comments

While working on the Kafka team for the last couple of months I have accomplished a wide range of tasks. The first notable effort I was a part of was helping to define our SLIs and SLOs and get a Grafana dashboard up in order to monitor them. The next contribution I made was upgrading the Kafka image on 14 of our production clusters to version 2.5.1. Following the image upgrades, I was tasked with trying to improve our existing partition rebalance process. This included running baseline tests and making configuration changes to a lab cluster in Azure with the hopes that these changes could be used in production. After some changes to the rebalance script along with the disk configuration on the cluster, I was able to make improvements to the process that will be pushed out to our first customer facing clusters in Azure. My final notable contribution to Kafka at Azure to date is the creation of alerts and an alert dashboard for the new clusters in Azure. These dashboards allow our support personnel to monitor the health of each cluster and alert the oncall personnel in the case of any urgent issues.

Whether directly or indirectly contributing to the effort, the tasks described all support my goal to help the team get Kafka readily available in the Azure environment. By accomplishing this goal, I feel I have been able to add value to the overall team.

5

I feel good about the things I have accomplished over the last few months here. As I have mentioned, my biggest goal was to learn as much as I possibly can. I believe that being coachable and having a supportive team around me has allowed me to accomplish this goal. I believe the tasks that I have completed show my ability to deliver results and contribute to the teams mission. I have also learned a lot about collaboration and the power that is held within a team. I was always hesitant to ask too many questions in the past, but through the collaborative environment on the team I have become more comfortable with not knowing things and asking questions instead of struggling through all the time. One of my biggest growth potentials is in building relationships. Being outgoing has always been hard for me, but though the TDP process I have gained confidence in reaching out to expand my network and build valuable relationships. I believe I have gotten better at this, but there is still plenty of room for improvement.

Development Focus

Strengths

Being Coachable

I believe that being coachable is essential in being able to learn. Being receptive to constructive criticism and advice and making changes based on those things will allow me to continue to grow.

Resilience and Resourcefulness

Being that it is early in my career, I am bound to make some mistakes. I think it important to be resilient and bounce back from failures. As long as I learn something valuable from my mistakes I think it was beneficial in some way. This mindset allows me to move past mistakes and become stronger because of them. Being resourceful is also very important. Doing research as well as leaning on more knowledgeable team members will result in less mistakes and better task completion.

Area For Improvement

Building Relationships

I believe I have improved on this skill, but there is still a lot of potential here. Building relationships with other team members has added a lot of value not only to my career, but life as a whole. Reaching out to rotation two managers helped break the networking ice for me and started to make me more comfortable in building professional relationships.

Taking Initiative and Risks

This is an important skill related to advancing my career. Without taking risks, I think it can be hard to stand out among the crowd. I would like to take the initiative more and manage risks while doing so. I believe this will accelerate my career in exciting ways.
